

Monstera Has Brown Spots

Monstera Has Brown Spots. Hello plant lovers welcome to another article about Monsteras, with me. Today in this topic we are going to talk about what should we do if Monstera has brown spots? And what they are showing.

There are lots of reasons for this to happen but the first reason and most important reason is overwatering, if you overwater your plant you will start to see brown spots on your Monstera's leaves.

Second reason can be deep inside the container you are keeping your plant. it can be rotten root problem, there are several reasons for this to happen and the main one is overwatering, when you water your plant more than you should, roots inside the pot start to get more and more water than required so the roots can't drain all the water so it makes the roots to rot.

Third reason is called root bound. The reason is when your plant out-grow the container which it is in, roots find no place to go and they start to get bounded with each other and container hold the plant back from growing and that damages the plant.

The final reason is sunlight, if your plant doesn't get enough sunlight it cannot get the energy required to produce and grow, so it will face hard times and plant cannot deliver required nutrients to the leaves.

If you are not a professional in plant subject, you might get surprised if I say too much sunlight also damages the plant and the energy it keeps receiving is too much that it burns the inner cells in the leaves so it turns out as brown dots and brown edges in the leaves.

Light Green Spots On Monstera Leaves

This mostly happens when Monstera grows new leaves, when new leaves are coming it usually takes a couple of weeks for a leaf to fully harden off.

Young leaves are still developing chloroplasts in their cells, they are the part of the plant that contain chlorophyll, this makes the plants green, and as the plants grow they get greener.

Because young leaves are thin they don't have lots of layer as older leaves have so they look like very light and even if the sunlight hits them it makes them look like even more lighter.

If the leaves don't get darker after few weeks, it means that something is wrong with your plant and it is not happy.

You better check soil, container, the amount of light they receive and other necessary thing that might cause it, so check it, fix it and it will be good again and shine with its glory.

Tiny Black Dots on Monstera

These dots can be caused by insects like lace bugs or other tiny insects called Aphids, some other disease or overwatering is one of the reasons that can cause this problem.

All these have solutions that can easily be solved, if it's overwatering, leave your plant and let it dry out between every watering and just water it till one or three inches of the soil gets moist.

If your plant is infested with bugs you can easily wash them off the plant but be careful while washing it, don't drown your plant's soil keep the water off the soil.
