

# What Temperature is Too Hot for Pannies?

What Temperature is Too Hot for Pannies? Hello plant lovers, welcome to another topic with me, in this topic we are going to talk about what temperature is too high for Pannies? and you need to avoid?

Pannies, these cheerful and very beautiful flowers that is mostly popular in cooler climates are hardy plants against cold temperature.

## **Pannies & Heat**

Pannies are annual plants, because they love cool weather rather than hot one.

In locations where heat gets a bit hot and the locations where it gets very hot in summer times, gardeners mostly choose to grow them in cooler times of the year, so they can bloom as they should.

Flowers of these plants don't want to bloom in the heat, if you plant this, it will bloom well until summer starts and weather gets warmer and warmer.

At that time the plant will wilt and will stop producing flowers.

## **Is it possible to grow Pannies in summer time?**

Of course, depends on where you live, you can grow any types you want.

You can find some varieties that have been developed for these kinds of situations and their heat tolerant are high, but they also are not big fan of hot weathers.

Even if you have these heat tolerant Pannies, you should be careful.

If the temperature of the location you live and you keep Pannies in, goes over 21°C (70 °F) they still will wilt a little and you will not witness their amazing blooming.

If you live in locations where the warmest temperature is below 21°C (70 °F), then I suggest you to plant them in summer time because that's the best time to plant these plants.
